

Print Technology	
Roto Color Technology	Roto color is a printing technology that presses designs onto the tiles by using large rollers. The gradual sideways movement of the roller ensures that tiles have minimal repeating designs.
Digital Technology	Digital printing uses wet glaze technology to print the pattern from an inkjet printer. The pattern is controlled by a computer program, which enhances the dimensionality and highlight contours of the pattern.
High Definition Technology	High definition printing utilizes the most advanced digital technology glazing system in the industry. Tiles are printed with higher resolution and greater variety of pattern.
