

USE, CARE & CLEANING STEPS

THERMOFOIL & LAMINATE DOORS

These doors can be wiped with a clean, damp cloth. To remove tough stains, use a soft cloth moistened with a mild soap or cleanser. Fine, soft scrub pads can be used without risk of damage if used gently.

WOOD DOORS, PANELS & MOLDINGS

A soft, lint free cloth should be used to dust cabinets frequently. The cloth can be slightly dampened with water or a spray dust remover. Clean and dry spills immediately, using a damp cloth if necessary and wipe dry with another cloth.

Should you have grease build up on your wood products we suggest using a damp cloth with mild soap or cleanser to remove the build up. Any product used should be rinsed off with a damp cloth. Dry thoroughly after cleansing as excess moisture can be damaging to any wood finish.

Do not use any abrasive pad or cleanser on your cabinetry. These products can damage the wood finish. Citrus oils, paste wax or polishes that contain silicone can leave a residue that is difficult to remove therefore we do not recommend the use of these types of products.

Euro-Rite sells a "touch-up" kit for our stained doors to touch up any nicks or scratches that can occur over time.

GLASS DOORS

Clean cabinet windows carefully. Do not spray glass cleaner directly onto glass as it can damage surrounding surfaces and/or tarnish hardware. Spray cleaner directly onto cloth, and then clean the glass.

CABINET INTERIORS

Clean interiors using a damp cloth and mild soap or cleanser. Do not use excessive amounts of water. Water can seep into the seams of the cabinet and cause the material to swell or warp. Sink base and vanity cabinets are the most likely to have some water damage. You can protect the surface with a plastic liner or pan.

HEAT AND HUMIDITY DAMAGE

Ovens, ranges, cook tops, toasters, cooking pots and other small appliances can produce large amounts of heat and steam. Ensure these items are positioned so that no heat or moisture becomes trapped under or along side cabinetry, otherwise, you risk damage to your doors, drawer faces and molding which is not covered under warranty. You should shield or (we recommend) remove any doors or drawer faces adjacent to a self cleaning oven. The radiant heat can be extremely high while cleaning and can damage or destroy cabinetry.

SUNLIGHT AND AGING

Direct and constant sunlight can fade or discolour cabinets and doors. Excess smoke and chemicals can also cause some materials to fade or vary from their original colour. Beware of how much sunlight, smoke and chemicals your cabinetry is exposed to. Cabinets or accessories added on later may not match the original cabinets installed. For the same reasons, display door samples may not represent the exact colour of cabinets received by the customer.
